

# ■ Capsat® Fleet77 – always online

Capsat® Fleet77 is based on the new Inmarsat Fleet service and is the next generation of maritime satellite communication terminals.

The Capsat® Fleet77 terminal offers high-speed and cost-effective voice and data communication based on either the MPDS (Mobile Packet Data Service) protocol with constant 24x7 online access or 64 kbps ISDN.

With Capsat® Fleet77 information can flow all the way from shore-based enterprise net-works to the captains and crews of any vessel on the high seas, offering significant advantages to fleet owners wishing to increase efficiency in the management of their maritime business.

MPDS provides constant ship/shore online access to applications such as remote supervision and diagnostics of onboard mechanical systems, cargo monitoring and control and purchase and logistics handling. Position reporting, electronic charts, weather reports, maintenance schedules and automatic equipment and machinery surveillance reports can now be transmitted and received as if the ship was part of the company LAN (Local Area Network).
