

■ Capsat® Fleet77 – online secure communication

Capsat® Fleet77 is based on the new Inmarsat Fleet service and is the next generation of maritime satellite communication terminals.

The Capsat® Fleet77 terminal offers high-speed and cost-effective secure voice and data communication based on either the MPDS (Mobile Packet Data Service) protocol with constant 24x7 online access or 64 kbps ISDN.

With Capsat® Fleet77 encrypted information can flow all the way from shore-based networks to the captains and crews of any vessel on the high seas.

With MPDS ships at sea have constant access to encrypted position reports, electronic charts, weather reports, maintenance schedules and automatic equipment and machinery surveillance reports, all transmitted and received

as if the ship was part of the secure company LAN (Local Area Network).
